YARTA

YINDYAMARRA ENVIRONMENTAL SUSTAINABILITY

Usability changes: what changed for each type of user

A usability pass, by user type, on the Yarta site, customer portal and team tool. It covers everything changed between 30 October and 2 November 2026, why each change was made, and the decisions still waiting before the remaining work can start.

STATUS

All changes are live on the GitHub Pages site and tested in a browser.

WHERE TO SEE IT

rdodeployme.github.io/yes-site Portal and team tool are demo prototypes; data stays in the browser.

UPDATES

5 published updates: four on 30 October and one on 2 November 2026.

AT A GLANCE

The site now holds up for every type of user, not just a single-site customer

The pass looked at the product through six types of user: the customer entering figures, customers in different industries, the manager or executive reading the result, the Yarta analyst checking the month, the sales team, and a prospect visiting the site. Each found real gaps. The biggest was that a council with 13 sites was told it had 9 figures to enter when it actually had 81.

81
required figures now counted correctly for a 13-site council (was 9)

3
required figures a month for a small business (was the full office set)

7
new figures customers can record (travel, refrigerants, gases, freight moved)

5.4:1
contrast of the orange on white, now passing the accessibility standard (AA)

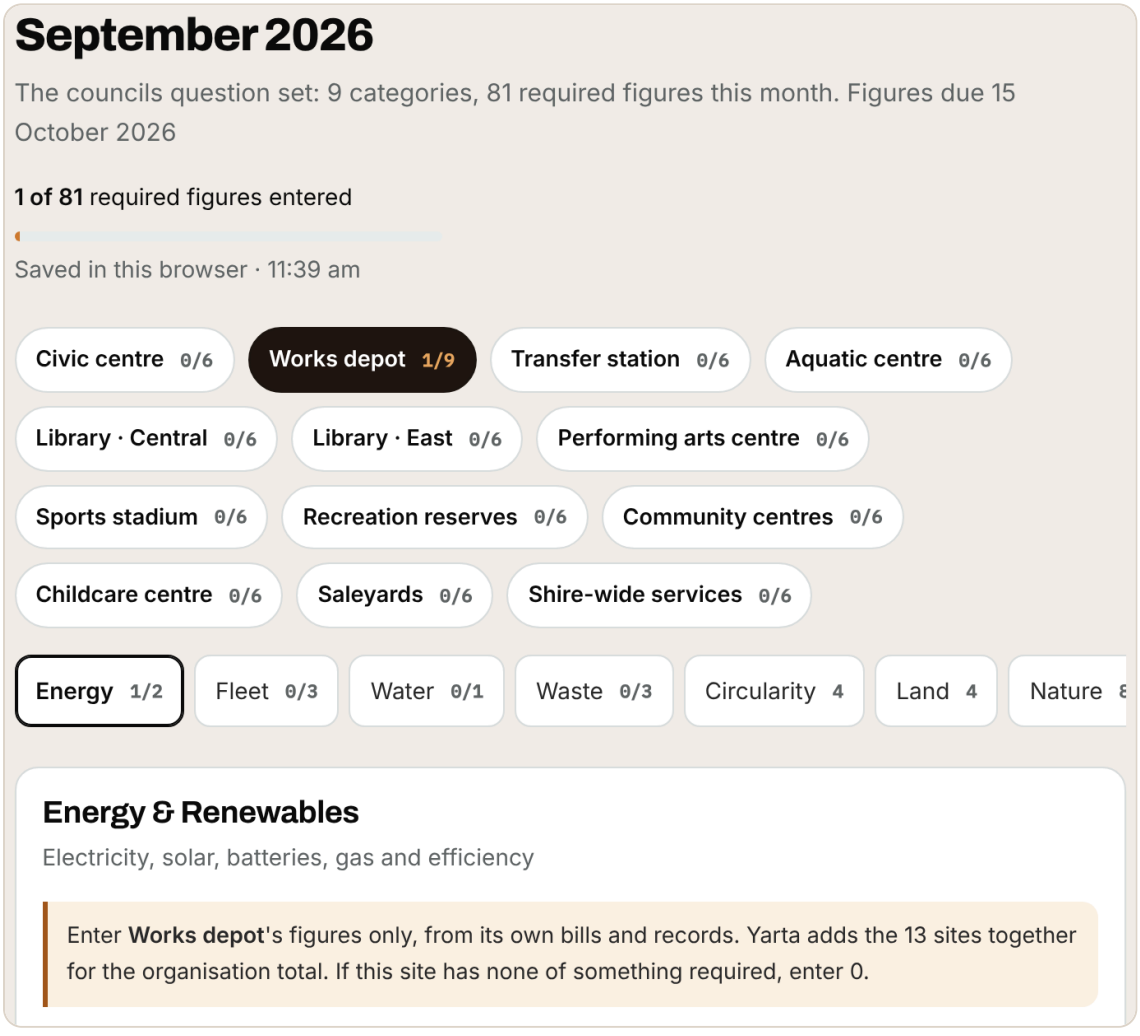

WHO	WHAT CHANGED FOR THEM
Customer entering figures	Required figures counted site by site, counters that update as you type, the whole-organisation total alongside the site's own, a send step that lists what's missing by site, spreadsheet import with a site column and a ready-made template, and an entry form that works with screen readers.
Customers in different industries	Offices are no longer asked to complete truck registers. New figures can be recorded for travel, refrigerants, anaesthetic gases and freight moved. Gas can be entered in GJ, MJ or kWh. Small businesses get a three-figure monthly set, and logistics customers get emissions per tonne-km.
Manager or executive	The monthly summary explains that the score covers every category they report, not emissions alone, and names the two weakest. Wording now separates "figures verified by Yarta" from "score self-declared".
Yarta analyst	The team tool matches the new self-entry model. The queue shows how long each month has waited, a month can be returned to the customer with a note they will see, and months the analyst keyed themselves are flagged.
Sales team	The sales guide and walkthrough no longer promise "you never key a number in". They describe customer self-entry, checked by a Yarta analyst.
Prospect on the website	The counters show real numbers instead of zeros on load. "Free to join" now reads "No set-up fee in the first 12 months". Accessible colours and focus rings are in place, and government agencies get the right sample report from the Readiness Check.

1 · CUSTOMER ENTERING FIGURES LIVE 30 OCT

Organisations with several sites can now complete a month without errors

> **The problem.** The site data was already stored separately for each site. But the screen counted required figures once for the whole organisation, so Demo Shire Council (13 sites) saw "9 required" and could send an incomplete month. Counters didn't move as figures were typed, and nothing said whether a figure belonged to one site or the whole council.

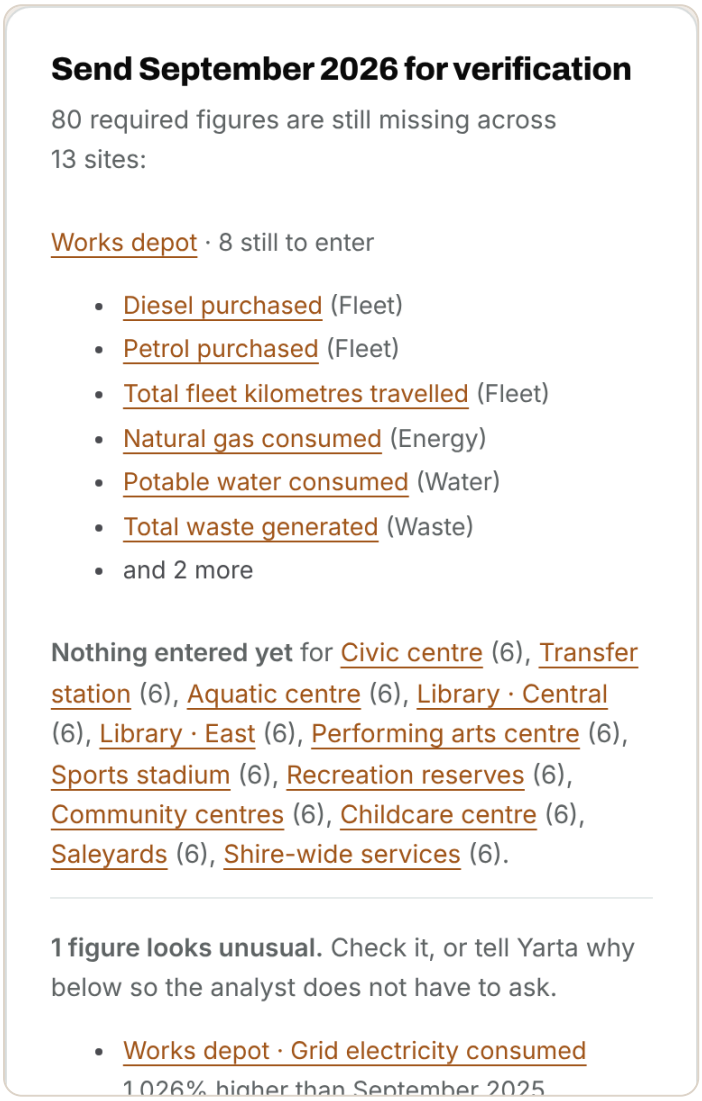

- **Required figures counted site by site.** Demo Shire now shows 81, and each site tab shows its own count (Works depot 1/9).
- **Counters update as you type,** on the site tab, the category list and the overall progress bar.
- **Each site tab says what it takes:** "Enter Works depot's figures only ... Yarta adds the 13 sites together." Field definitions read "At Works depot: ...".
- **The calculation panel shows the whole organisation,** with the selected site's share underneath, so nobody mistakes a site total for the council total.

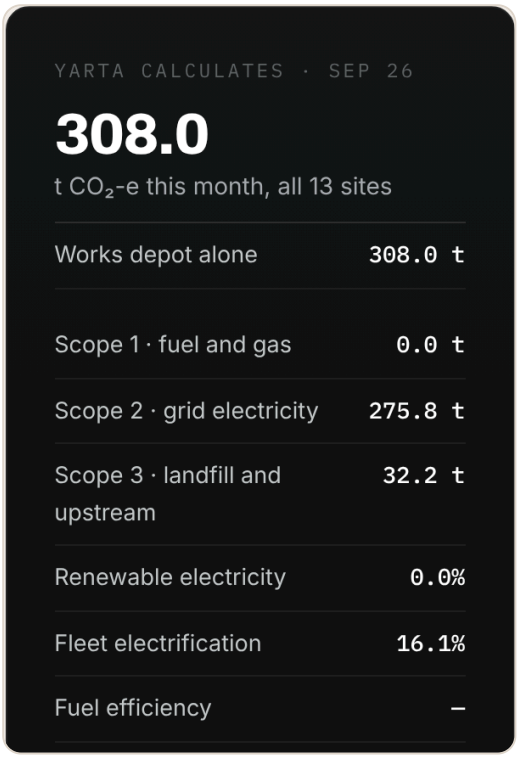

Month entry, Demo Shire Council. 81 required figures across 13 site tabs, each with its own counter, and a note saying this tab takes Works depot's figures only.

Sending the month, importing a spreadsheet

- **The send step lists what's missing, grouped by site.** Sites with nothing entered collapse into one line, so a council doesn't scroll through 80 items.
- **Unusual figures are flagged before sending,** for example "1,026% higher than September 2025". There's an optional note to Yarta, so the analyst doesn't have to ask.
- **Spreadsheet import takes a site column.** It is required for organisations with more than one site, and a file without it is refused with a clear message. A "Download template" button gives the exact shape for the month: month, site, field, unit, required, value.
- **Accessibility:** each figure is announced with its label, definition and whether it's required. Errors are marked as errors, and warnings and totals are read out as they change.

Send step. What's missing at each site, unusual figures, and a note to Yarta.

Calculation panel. The whole organisation (all 13 sites) first, then "Works depot alone".

See it: portal → sign in as **Alex Morgan** (Demo Shire Council) → Enter your figures → Enter September 2026.

2 · CUSTOMERS IN DIFFERENT INDUSTRIES LIVE 30 OCT

Each industry is asked the right questions

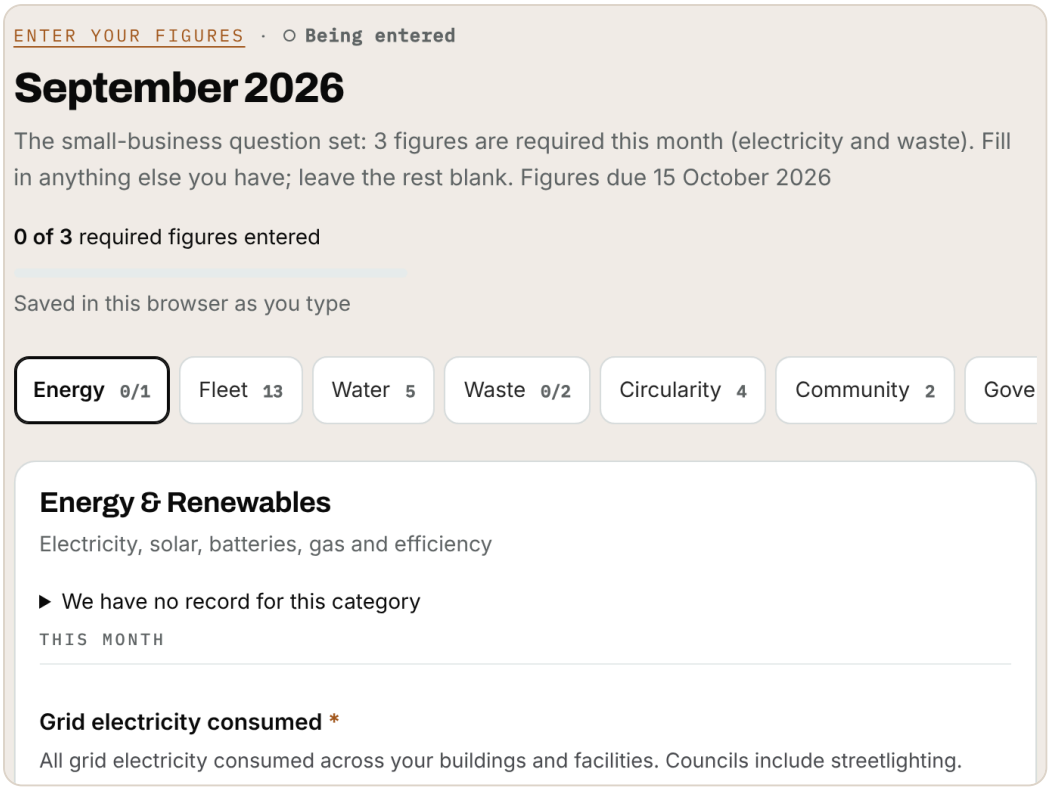

> **The problem.** An office was asked to complete diesel, petrol and truck registers as required figures. A 14-person studio faced the full business set. Retail had nowhere to record refrigerant top-ups, health had nowhere for anaesthetic gases, and logistics had no way to show efficiency per load.

Question sets

- **Offices:** fleet figures (fuel, kilometres, vehicles) are optional, and truck registers are no longer asked.
- **Small businesses** (up to 30 staff, not councils): three required figures a month. They are grid electricity, total waste and waste to landfill. Everything else is optional, and the month form says so in one line.
- **Gas** can be entered in GJ, MJ or kWh. It is converted and saved as GJ, and the form says so.
- **The electricity definition fits everyone** (2 Nov). It used to mention streetlighting to every customer and now reads "Councils include streetlighting".

New figures customers can record

FIGURE	WHO IS ASKED	STATUS
Rideshare and taxi spend; hotel nights	Every industry except logistics	Recorded, not yet in totals: emissions factor needs approval
Share of staff who drive alone to work	Councils, business, health, education (yearly)	Recorded, not yet in totals
Refrigerant topped up (kg) and main gas	Retail, health, logistics, manufacturing, education, business, councils	Recorded, not yet in totals: emissions factor needs approval
Anaesthetic gases	Health	Recorded, not yet in totals: emissions factor needs approval
Freight moved (tonne-km)	Logistics	**Live:** emissions per tonne-km (section 5)

Small-business month form, Demo Design Studio (14 staff). "3 figures are required this month (electricity and waste)". The other categories show optional counts only.

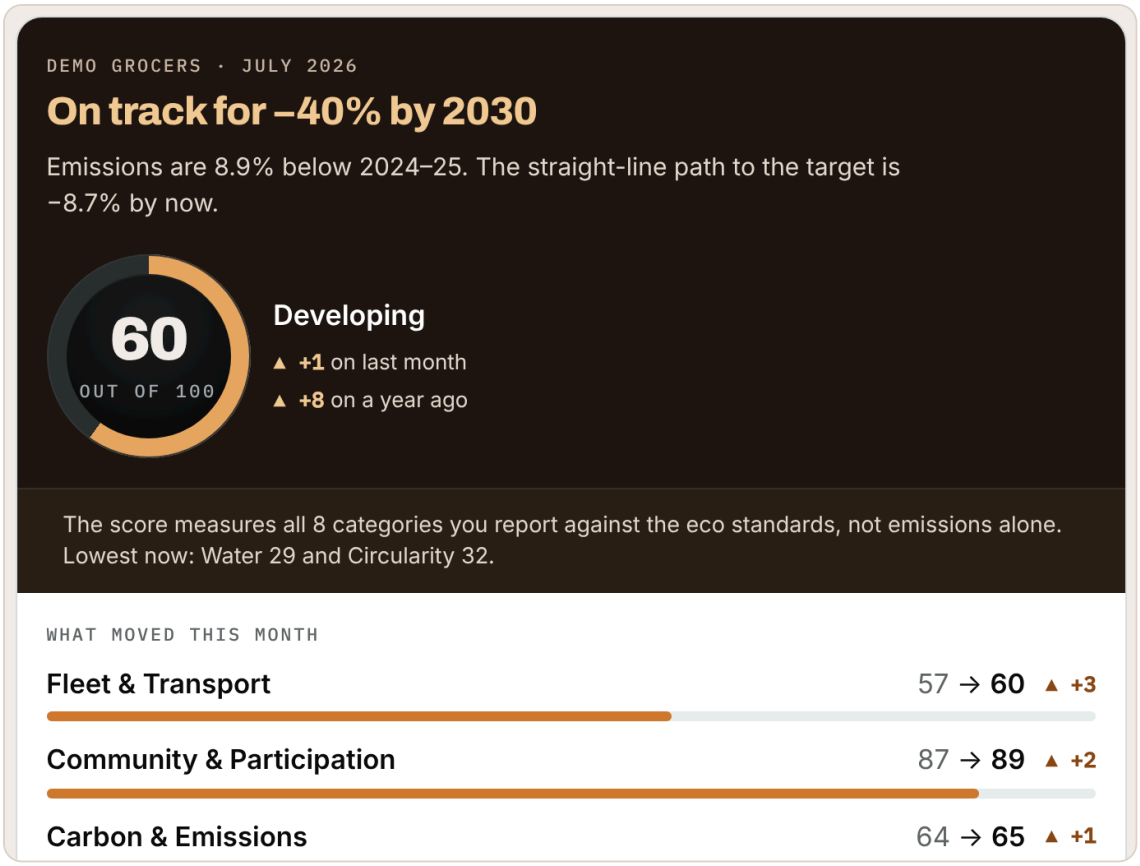

See it: sign in as **Mia Chen** (Demo Design Studio, new demo account).

3 · MANAGER OR EXECUTIVE LIVE 30 OCT

The score explains itself, and the claims are worded precisely

> **The problem.** An executive could see emissions falling and the score barely moving, with nothing to say why. Some pages also said "verified" in a way that could read as a verified score, when Yarta verifies the figures and the score is self-declared under the published method.

- **One line on the monthly summary and in its email text** says the score measures every reported category against the eco standards, not emissions alone. It also names the two lowest categories (Demo Grocers: Water 29 and Circularity 32).
- **Verified and self-declared are now separate everywhere:** "Figures verified by Yarta · score self-declared under the published Yarta Method, not an accredited rating".

Monthly summary, Demo Grocers. The new line sits under the headline: "The score measures all 8 categories you report ... Lowest now: Water 29 and Circularity 32."

See it: sign in as **Hannah Park** (Demo Grocers) → Monthly summary.

4 · YARTA ANALYST LIVE 30 OCT

The team tool now works for checking months customers enter themselves

> **The problem.** The team tool still assumed Yarta keyed every number from documents. Demo months had no customer behind them, the queue gave no sense of urgency, and an analyst who found a problem had no way to send the month back to the customer.

- **Demo months are entered by the customer** (for example "Alex Morgan (customer)"), matching how the product now works.
- **The verification queue** shows each customer's industry, how many days the month has waited, and required figures (81/81 for the council). Months the analyst keyed themselves go last, marked "View · you keyed it", so nobody verifies their own work.
- **Return for correction:** the analyst writes a note (required), and the customer sees it on their entry screen, along with a friendly "Please check: ..." email. The month shows as "Returned for correction" until it is resent.

- **The review page is cleaner:** technical field IDs are moved out of view, the customer's note to Yarta shows at the top, and dollar figures show as $. The Today page and the analyst manual are reworded for self-entry.

ORGANISATION	MONTH	SENT	WAITING	REQUIRED	DOCUMENTS	FLAGS	ENTERED BY	
Demo Coastal Council Councils · NSW	July 2026	9 August 2026	85 days	9 / 9	9	6	Sam Nguyen (customer)	Review
Demo Freight Co. Logistics and transport · QLD	July 2026	9 August 2026	85 days	29 / 29	9	4	Jordan Blake (customer)	Review
Demo Shire Council Councils · VIC	August 2026	9 September 2026	54 days	81 / 81	9	5	Alex Morgan (customer)	Review
Demo Freight Co. Logistics and transport · QLD	August 2026	9 September 2026	54 days	29 / 29	9	1	Jordan Blake (customer)	Review

Verification queue. Industry under each name, days waiting, required figures counted per site, and who entered the month.

See it: rdodeployme.github.io/yes-site/tool/ → Verification.

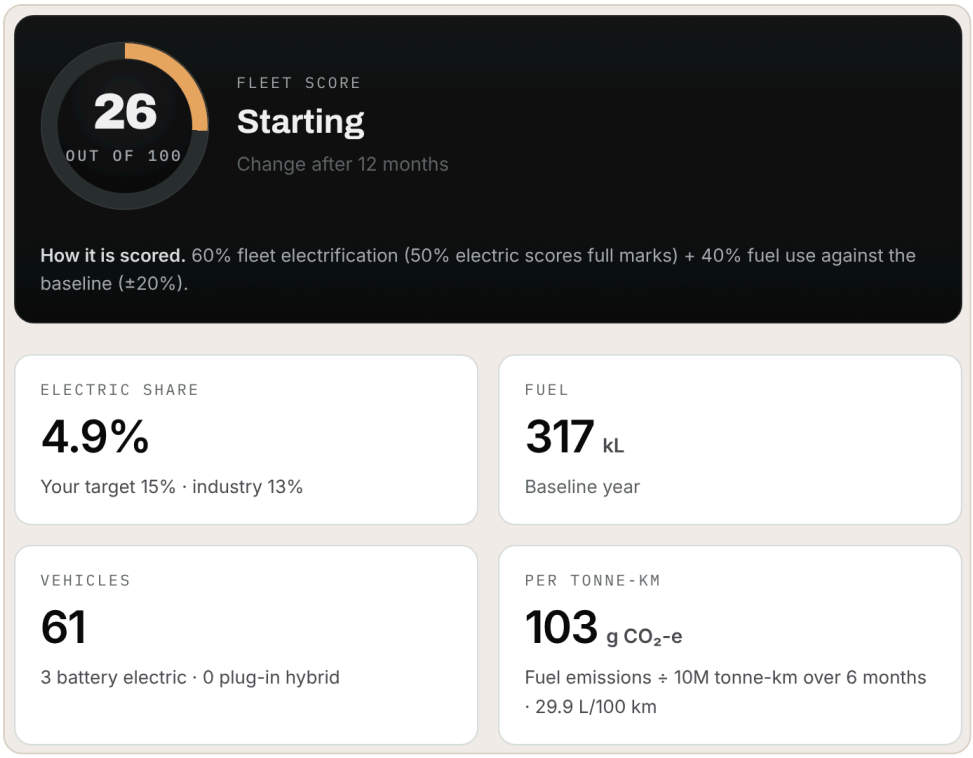

5 · LOGISTICS CUSTOMERS LIVE 30 OCT

Freight operators see emissions per tonne-km

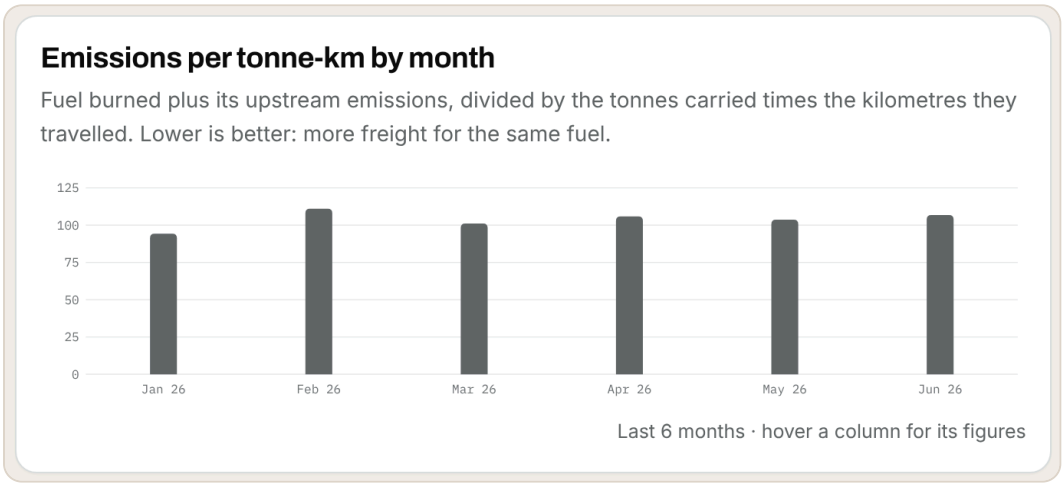

> **The problem.** For a freight business, total fuel rises when it wins more work. Without a per-load measure, a business that is getting more efficient looks like it's getting worse.

- **Grams of CO_2-e per tonne-km:** the emissions from fuel bought (burned, plus the emissions from producing it) divided by tonnes carried × kilometres travelled.
- **Over a period, only months that report tonne-km count,** so a month with fuel but no tonne-km doesn't distort the figure.
- **Where it shows:**
  - a "Per tonne-km" figure and a monthly chart on the Fleet page
  - the live calculation panel
  - the monthly report's key figures
  - the rates table on the Yarta Method page

  Other industries don't see it.
- **Checked by hand:** 30,000 L of diesel over 950,000 tonne-km gives 107 g, which matches.
- **No industry comparison yet.** There is no published Australian road-freight average to compare against, so each customer is measured against its own trend.

Fleet & Transport, Demo Freight Co. "Per tonne-km: 103 g CO_2-e" over 6 months, with litres per 100 km underneath.

Emissions per tonne-km by month. Lower is better: more freight moved for the same fuel.

See it: sign in as **Jordan Blake** (Demo Freight Co.) → Fleet & Transport.

6 · SALES TEAM AND PROSPECTS LIVE 30 OCT

The site says what the product actually does, and everyone can read it

> **The problem.** The sales guide promised customers would "never key a number in", which contradicts self-entry. The homepage counters showed zeros until you scrolled. "Free to join" wasn't accurate. The brand orange failed the accessibility contrast standard for text and buttons.

Sales guide and walkthrough

- Rewritten for customer self-entry, checked by a Yarta analyst.
- The walkthrough step now opens the real entry screen.

Public site

- **Counters** show their real numbers on first load instead of starting from zero.
- **Pricing:** "No set-up fee in year one" and "No set-up fee if you join in the first 12 months" replace "Free to join".
- **Readiness Check:** "Government agency" and "Something else" now get the business sample report instead of a mismatched one.

Accessibility

ELEMENT	CHANGE	RESULT
Brand orange (text, links)	Darkened to #A3561A. The brighter orange stays for buttons with dark text.	5.38:1 on white (AA needs 4.5:1)
Primary buttons	Dark text on the bright orange; white on the darker orange when hovered.	Passes AA
Keyboard focus	A 3 px focus ring on every link, button and field. It switches to a lighter colour on dark backgrounds so it stays visible.	Visible on all surfaces
Grey secondary text	Darkened on light backgrounds, lightened on dark ones.	Passes AA

Every page was also checked at phone width (390 px). Nothing runs off the side of the screen and there are no script errors.

7 · WAITING ON DECISIONS

What's left needs a decision, not more building

The new travel, refrigerant and anaesthetic figures are collected now but kept out of totals. They count once their emissions factors are approved. One question was settled during the pass: Australia's national reporting rules (NGER) require the IPCC's 2014 (AR5) climate-impact values, so Yarta uses those for refrigerants. That matches the national accounts and needs no decision.

1. **Travel factors:** use the UK Government's annual conversion factors (DESNZ), since there are no Australian ones for flights, hotels or taxis. Include the uplift for high-altitude flight effects, which roughly doubles flight emissions; this is the more conservative and common choice.

2. **Flights by distance:** ask for kilometres from the travel booking report, falling back to an average distance per trip when it isn't available.

3. **Refrigerants per gas:** let a site enter up to three refrigerant gases, each with its own kilograms, instead of one "main gas".

4. **Fleet score for logistics** (suggestion): for customers who report freight moved, score the fuel part (40%) on emissions per tonne-km instead of total fuel, so growing businesses aren't penalised for winning work.

Once 1 to 3 are approved, the build is about a day: factors into the calculations, a new method version, history recalculated, and the method page updated.

Production item

- The "check it's genuine" link on reports still points at the github.io address. It moves when yes.com.au goes live.

Where the detail sits

- `yes-factor-proposal-30oct.md`: factor values, sources and the decisions above.
- `yes-usability-pass-30oct.md`: findings by user type and the status of each fix.
- `yes-accessibility-30oct.md`: the accessibility audit.

All three are in the Yarta project. The code changes are in the yes-site repository (5 updates, 30 October to 2 November 2026).
